Reactions involving Hydrocarbons

Combustion of Hydrocarbons

- * All hydrocarbons burn with oxygen to form large amounts of heat and light
- * Hydrocarbon + 0_2 \rightarrow CO_2 + H_2O

- * Eg. C3H8 + $O_2 \rightarrow CO_2 + H_2O$
 - * (not balanced! Balance it!)

Combustion

Complete Combustion: Enough oxygen to carry out combustion

$$CH + O_2 \rightarrow CO_2 + H_2O$$

Combustion

Complete Combustion: Enough oxygen to carry out combustion

$$CH + O_2 \rightarrow CO_2 + H_2O$$

Incomplete Combustion: Not enough oxygen to carry out combustion

$$CH + O_2 \rightarrow CO + C$$

- * Example: write a balanced chemical equation to represent the complete combustion of hex-1-ene. Use a condensed structural formula to represent hex-1-ene.
- * Step 1: write the word equation
- * hex-1-ene + oxygen carbon dioxide + water

- * Step 2: write the chemical equation, using a condensed structural formula for hex-1-ene
- * CH2=CHCH2CH2CH2CH3 + O2. CO2 + H2O

- * Step 3: Balance the chemical equation:
 - * CH2=CHCH2CH2CH2CH3 + 9 O2. 6 CO2 + 6 H2O

Addition Reactions

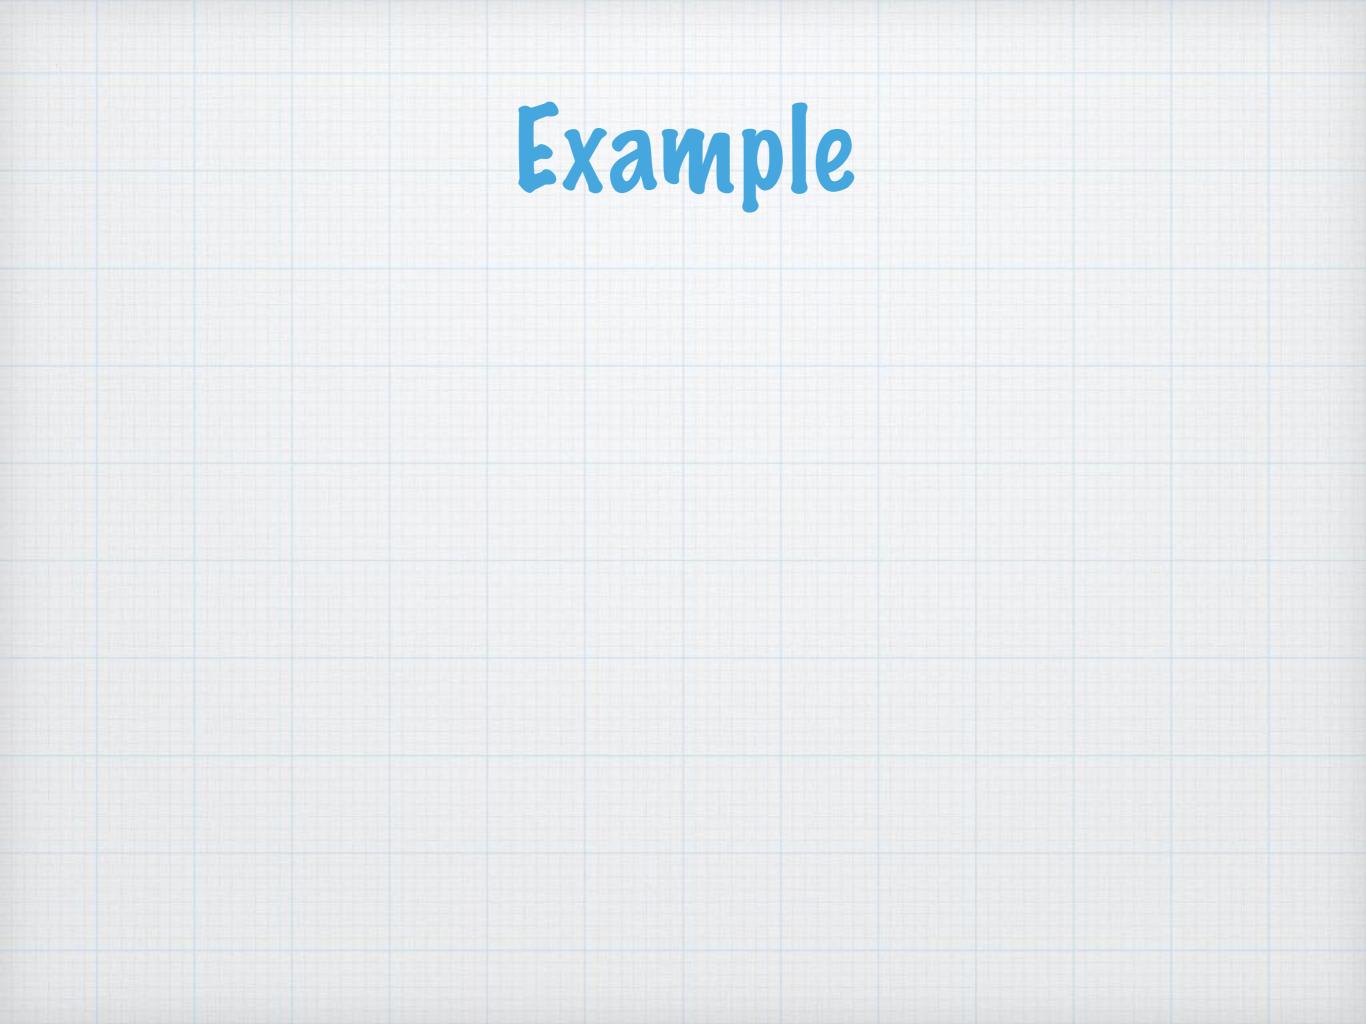

- * Occurs with alkenes and alkynes
- * Pouble and triple bonds can be converted to single bonds
- * Can add hydrogen, halogens, or small groups (like -OH) to the carbon atoms

- * Example: Draw a structural formula equation for the following addition reaction:
- * ethene + hydrogen ethane

* ethene + hydrogen

ethane

- * Example: Draw a structural formula equation for the following addition reaction:
- * but-2-ene and hydrogen chloride

Substitution Reactions

- * Occur when an alkane and a halogen react under UV light.
- * Not an addition reaction (where there are 2 reactants and 1 product)
- * 2 reactants and 2 products in substitution reactions

* Example: Praw structural formulas to show the substitution reaction of methane and bromine
