

# The Mole

# Avagadro

- \* In 1811, Amedeo Avagadro determined that any convenient quantity of matter must contain an enormous number of atoms, ion, molecules, ect.

# Mole

- \* If we look at the quantity of items equal to  $6.02 \times 10^{23}$ , we call this a mole.
- \* This is also known as Avogadro's Number,  $N_A$

\* A mole is just a quick way of summarizing large quantities.

\* A pair giraffes:

\* A pair giraffes:

\* A mole ( $6.02 \times 10^{23}$ ) of giraffes

# Converting Mole to # of Particles

\* Converting Moles to Number of Particles

\*  $N = n \times N_A$

\* N = Number of particles (atoms, molecules, ect)

\* n = number of moles

\*  $N_A = \text{Avagadro's constants } (6.023 \times 10^{23})$

# Example

- \* A sample contains 1.25 mole of nitrogen dioxide,  $\text{NO}_2$ , how many molecules are in the sample?

# Example

\* Given

\*  $n = 1.25 \text{ mol}$

\*  $N_A = 6.023 \times 10^{23}$

\* Required

\*  $N$

# Example

\* Given

\*  $n = 1.25 \text{ mol}$

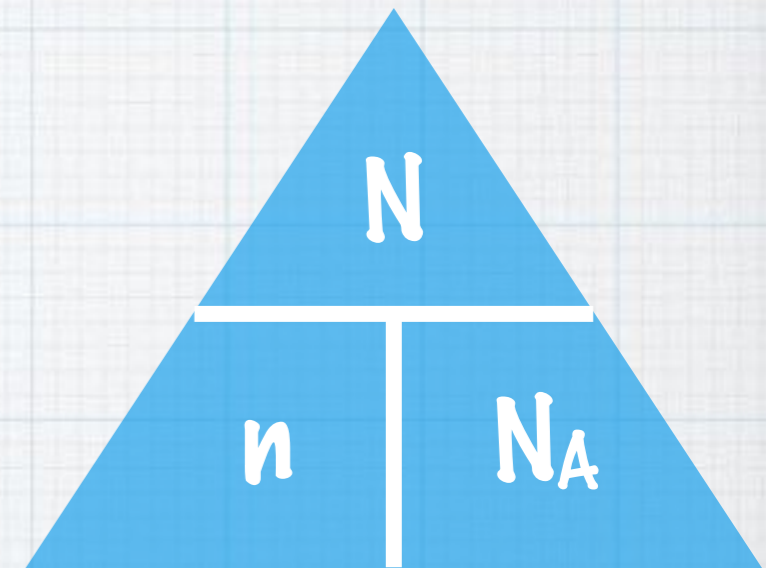

\*  $N_A = 6.023 \times 10^{23}$

\* Required

\*  $N = n \times N_A$

\*  $N = 1.25 \times (6.023 \times 10^{23})$

\*  $N = 7.52 \times 10^{23}$

# Atomic Mass

- \* Atomic Mass: The mass of one atom of an element

# Molar Mass

- \* **Molar Mass: sum of the total mass of all atoms that make up one mole of substance**

# Molar Mass

- \* On the periodic table, atomic weight is equal to the mass of one mole of substance.
- \* Example: What is the molar mass of one mole of sodium?

# Molar Mass

- \* Example: Eg: Determine the mass of one molecule of carbon dioxide,  $\text{CO}_2$

# Practice

- \* What is the molar mass of each of the following?
- \* A)  $\text{H}_2\text{S}$
- \* B)  $\text{SO}_3$
- \* C)  $\text{PO}_3$

# Practice

\* Example: Molar mass of alanine,  $C_3H_7NO_2$

\*  $C = 3 \times 12.01 \text{ g} = 36.03 \text{ g}$

\*  $H = 7 \times 1.01 = 7.07 \text{ g}$

\*  $N = 1 \times 14.01 \text{ g}$

\*  $O = 2 \times 16.00 \text{ g} = 32 \text{ g}$

\* TOTAL: 89.01 g/mol

# Example

- \* Example molar mass of an ionic compound
- \* Molar mass of  $\text{Al}(\text{NO}_3)_3$ 
  - \*  $\text{Al} = 1 \times 26.98 \text{ g} = 26.98$
  - \*  $\text{N} = 3 \times 14.01 \text{ g} = 42.03 \text{ g}$
  - \*  $\text{O} = 9 \times 16.00 \text{ g} = 144 \text{ g}$
- \* TOTAL = 213.01 g/mol

# Try It!

\* Calculate the molar mass of each of the following

# Answers

\* Answers:

\*  $C_6H_6$ ,  $M=78.0$  g/mol

\*  $Ba(NO_3)_2$ ,  $M=261.35$  g/mol

\*  $K_3PO_4$ ,  $M=212.27$  g/mol

\*  $NH_3$ ,  $M=17.04$  g/mol

# Converting From Mass to Moles

- \* We know that molar mass represents the mass in grams per mole of substance (g/mol)
- \* Therefore,  $M = m/n$ 
  - \* Where  $M$  = molar mass
  - \* Where  $m$  = mass
  - \* Where  $n$  = number of moles

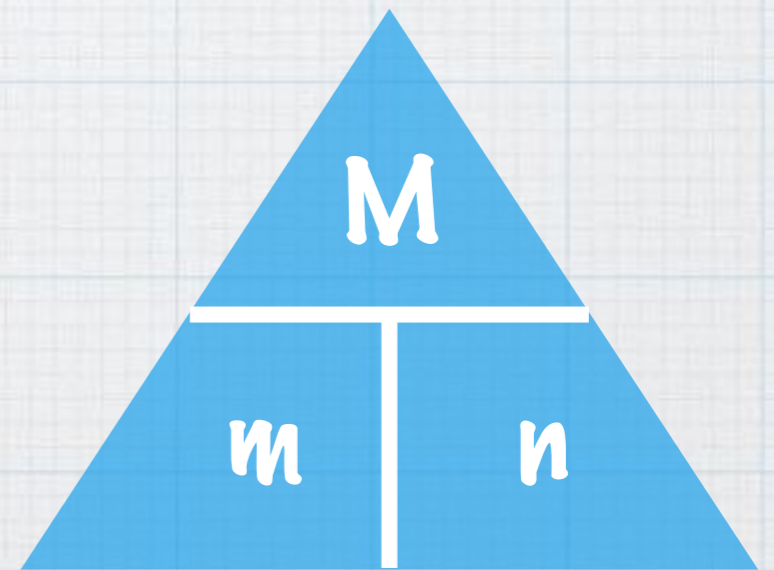

# Converting to Mass

\* To convert to mass from number of moles

\*  $\text{Mass} = \text{Number of Moles} \times \text{Molar Mass}$

\*  $m = n \times M$

# Example

\* What is the mass of 2.0 moles of Na?

# Example

- \* What is the mass of 2.0 moles of Na?
- \*  $m = n \times M$
- \*  $m = 2.0 \text{ mols} \times 23 \text{ g/mol}$

Therefore the mass of 2.0 mols of Na is 46 g.

# Example

\* How many moles are in 57.5 g of Na?

# Example

\* How many moles are in 57.5 g of Na?

\*  $n = m / M$

\* Given:  $m=57.5\text{g}$       $M=23.00\text{ g/mol}$  (from periodic)

# Example

$$* n = \frac{57.5 \text{ g}}{23.00 \text{ g/mol}}$$

$$* n = 2.5 \text{ mol}$$

Therefore there are 2.5 moles in 57.5 g of Na.

# How to calculate number of atoms from mass

\* Remember

# How to calculate number of atoms from mass

- \* How to calculate number of atoms from mass
- \* 1) Step 1: Calculate the number of moles using  $n = m / M$
- \* 2) Step 2: Calculate the number of atoms using  $N = n \times N_A$

# Example

- \* Calculate the number of atoms of gold in a 275.8g nugget of pure gold.

# Example

\* How many moles are in 275.8 g of Au?

\* Given:

\*  $m=275.8\text{g}$

\*  $M=196.97\text{ g/mol}$ (from periodic table)

# Example

- \*  $n = m / M$

- \*  $n = \frac{275.8 \text{ g.}}{196.97 \text{ g/mol}}$

- \*  $n = 1.40 \text{ mol}$

Therefore there are 2.5 moles in 1.40g of Au.

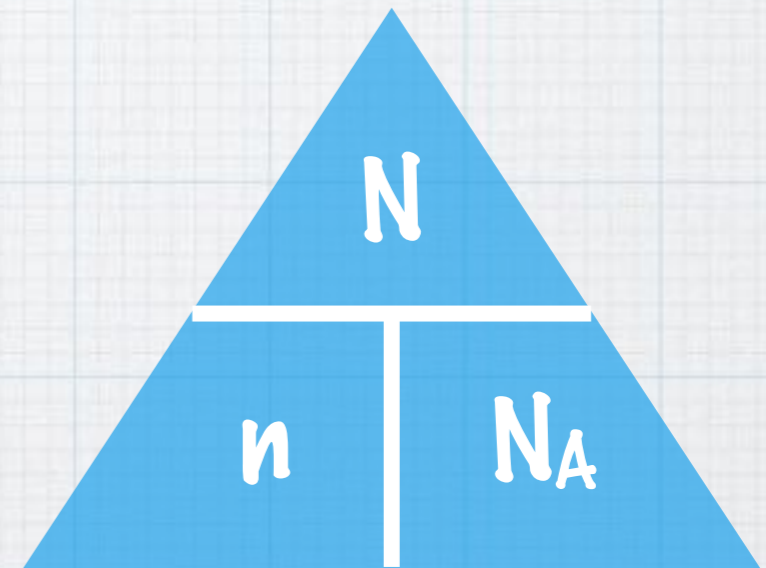

# Example

\* How many particles are in 1.40 mol of Au?

\* Given:

\*  $n = 1.40 \text{ mol}$

\*  $N_A = 6.02 \times 10^{23}$

# Example

- \*  $N = n \times N_A$

- \*  $N = 1.40 \times 6.02 \times 10^{23}$

- \*  $N = 8.43 \times 10^{23}$  atoms

- \* Therefore there are  $8.43 \times 10^{23}$  atoms in one nugget of gold.

# Try It!

- \* How many atoms of sulphur are in a 230.0g sample of pure sulphur?
